USER GUIDE

FIRST EDITION

A TEMPORAL NAVIGATION INSTRUMENT

BY ANCIENT BITFORGE

CONTENTS

This guide explains the core concepts and daily operation of Arrival. It is written for first-time users and for reviewers who need to understand the product without relying on a conventional calendar model.

01 CORE CONCEPT

Time as a radial field

02 MAIN SCREEN

Radar, slider, operational field and resource deck

03 TIME NAVIGATION

Near Days, Rest of Week, Weeks, Upcoming Months and Beyond

04 EVENTS

Create, inspect, edit, delete and attach context

05 NOTES AND RESOURCES

Written notes, voice notes, camera, scanner, files and drawer

06 SETTINGS

Language, regional behavior and About Arrival

07 WORKFLOWS

Practical use patterns and terminology

CORE CONCEPT

THE FUTURE IS NOT A LIST IT APPROACHES

Arrival is built around a simple premise: personal time is easier to understand when it is seen as distance from the present, not as a grid of empty boxes.

The center is Today. Events appear around it according to their temporal distance. As an event gets closer, it moves toward the operational present.

PRINCIPLES

- Show what exists; avoid giving visual weight to empty time.
- Treat events as commitments that may require preparation.
- Keep context attached to the event: notes, voice, files, scans and photos.
- Do not judge importance; show distance, preparation and state.

MAIN SCREEN

Arrival has three main working areas. The layout is deliberately stable: the radar remains at the top, the operational field remains below it, and the resource deck remains at the bottom.

1. TEMPORAL RADAR

The circular field shows upcoming events as points around Today.

2. SCALE SLIDER

Move from Near to Far to change the scale of time without changing the basic geometry.

3. OPERATIONAL FIELD

Today is where events become actionable. This area is not a calendar grid; it is the present working field.

4. RESOURCE DECK

Create events and add context through notes, voice, camera, scanner, files and the drawer.

READING THE RADAR

- The center represents Today, the fixed reference point of the system.
- The rings represent temporal horizons. Their meaning depends on the selected scale.
- Event points show where commitments are located in the current horizon.

NEAR DAYS

The immediate horizon for practical planning.

- Use this scale to see what is close enough to affect today and the next few days.
- It is the best view for short-term preparation and immediate awareness.

REST OF WEEK

The current week as a compact temporal field.

- This view keeps the week readable without filling the screen with empty calendar cells.
- Use it to understand how the remaining days relate to Today.

WEEKS

The bridge between the current week and the wider month.

- This scale is useful for workload distribution and medium-term commitments.
- It preserves the same radial language while expanding the horizon.

UPCOMING MONTHS

A wider horizon for monthly planning.

- Use this view for events that are not immediate but should not disappear from awareness.
- The month labels provide orientation without requiring a traditional calendar page.

BEYOND

Long-range commitments without calendar clutter.

- Beyond is for events outside the normal planning horizon.
- It keeps long-term commitments visible without mixing them with daily operations.

TODAY / OPERATIONAL FIELD

The Operational Field is the place where future commitments become present work. It is intentionally separate from the radar: the radar shows what approaches; the field shows what is here.

WHAT IT SHOWS

- Event time, when available.
- Event name.
- Preparation state, such as completed and pending elements.
- A Close action when the event is no longer active.

An event arriving in Today does not simply disappear from the future. It enters the operational present, where the user can complete, close or review it.

CREATING EVENTS

Events are the central unit of Arrival. An event may be simple, like an appointment, or preparatory, like a birthday, a trip, a meeting or an administrative task.

FIELDS

- Event - the visible name of the commitment.
- Date - the day where the event belongs.
- Without Time - use when the event has no exact hour.
- Time - use the HH:mm format when time matters.
- Elements - preparation items connected to the event.
- Attach - link files, notes, scans or other context.

ELEMENTS + ATTACH

NEW EVENT

EVENT CARDS

Tap an event point or an event row to inspect its card. The card is the compact operational view of a commitment.

AVAILABLE ACTIONS

- Attach - add context to the event.
- Edit - return to the event form.
- Delete - remove the event.
- Close - leave the card and return to the main screen.

ELEMENTS

Elements are not separate tasks floating elsewhere. They remain attached to the event they prepare.

WRITTEN NOTES

Written notes capture information that should stay near the relevant commitment. A note can be used for addresses, meeting details, instructions, reminders, references or short fragments copied from another source.

TYPICAL USES

- Paste a reference number or address.
- Write preparation details before an event.
- Keep contextual information out of separate apps.

WRITTEN NOTE

OPTIONAL TITLE

WRITE NOTE

CONTINUE

Tip: use short, precise notes. Arrival works best when each note supports a specific event or decision. Device keyboards and clipboard menus may look different on each Android phone.

VOICE NOTES

Voice notes are useful when writing would be too slow or when the context is better captured by speech. They can be recorded quickly and then used as an attached resource.

FLOW

- Ready - the recorder is prepared.
- Record - capture the voice note.
- Use Note - attach the recorded file.
- Cancel - exit without keeping the note.

Keep voice notes intentional. They are best used as context, not as a second inbox of forgotten audio files.

ATTACHMENTS AND RESOURCES

Arrival can connect external context to events. This is what turns an event from a reminder into a prepared commitment.

CAMERA

Opens the device camera to capture a photo related to the event.

SCANNER

Opens the document scanner for paper documents, forms and printed material.

FILES

Opens the native Android file picker so you can select existing documents.

DRAWER

Opens Arrival resources already stored or associated with your work.

The camera, scanner and file picker are native Android components. Their appearance may vary by device manufacturer. The behavior is standard: choose or capture the item, then attach it to Arrival.

SETTINGS

Settings keep the application readable across languages and regional conventions while preserving the radar geometry.

CONTROLS

- Language - choose the interface language.
- Week Start - follow device region or a preferred week start.
- Event Time Entry - follow device format or a selected format.
- About Arrival - product information and conceptual notes.

The radar always remains on a 24-hour scale. Language and regional settings do not change the radar geometry.

DAILY WORKFLOW

A practical daily workflow in Arrival is built around three questions.

01

WHAT IS APPROACHING?

Use Near Days and Rest of Week to understand the immediate horizon.

02

WHAT REQUIRES PREPARATION?

Open event cards and review elements, notes and attachments.

03

WHAT HAS ARRIVED?

Use Today / Operational Field to close or complete active commitments.

Arrival is not designed to make the user serve the system. It is designed to return clarity: what exists, what approaches, and what needs context before it arrives.

PLANNING HORIZONS

The farther scales are not replacements for detailed daily planning. They exist to keep meaningful future commitments visible without forcing them into a dense monthly grid.

USE UPCOMING MONTHS FOR

- events that are not immediate but need awareness;
- dates that require preparation before they become urgent;
- medium-range planning without calendar clutter.

USE BEYOND FOR

- long-range commitments;
- distant events that should not be forgotten;
- strategic planning outside the near horizon.

QUICK REFERENCE

NEAR DAYS	Immediate upcoming days.
REST OF WEEK	The remaining days of the current week.
WEEKS	Medium horizon across the coming weeks.
UPCOMING MONTHS	Monthly horizon for non-immediate commitments.
BEYOND	Long-range planning view.
OPERATIONAL FIELD	Today, where events become actionable.
ELEMENTS	Preparation items attached to an event.
ATTACH	Add notes, files, photos, scans or other context.

DEVICE BEHAVIOR

Arrival uses Android-native capabilities where they make more sense than custom replacements. This is intentional: device-level components are familiar, maintained by the operating system and adapted to each manufacturer.

EXPECTED VARIATIONS

- The keyboard may look different depending on the device and the selected Android keyboard.
- The camera interface may differ by manufacturer.
- The scanner and file picker may use Android or vendor-specific panels.
- Language and date formatting may follow the device region unless changed in Settings.

GOOD PRACTICE

- Keep event names short and readable.
- Use elements for preparation, not for every minor detail.
- Attach only context that will help when the event arrives.
- Review Near Days regularly; use farther scales for orientation.
